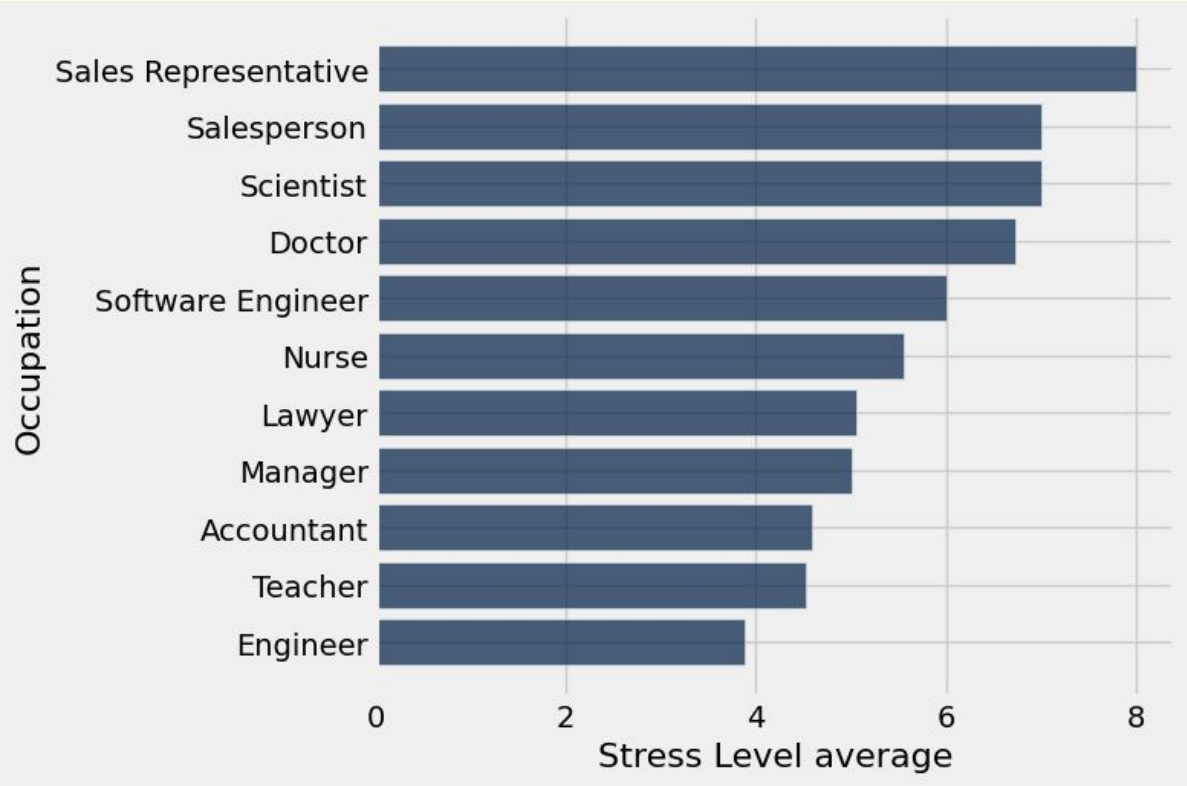
How to Know What Career is Best For You

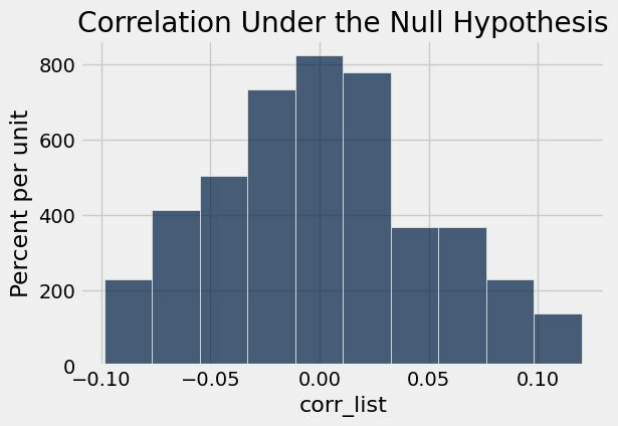
Which occupations are the most stressed?

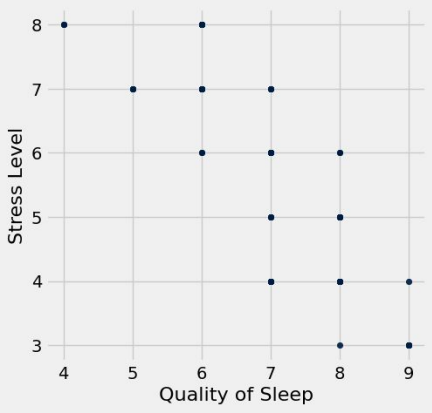


Permutation Test: Quality of Sleep vs. Stress Level

Observed correlation: -0.898752031004
p-value<0.001

-0.898752031004





H0: there is no association between Stress Level and Quality of Sleep

H1: Higher sleep quality leads to lower stress levels

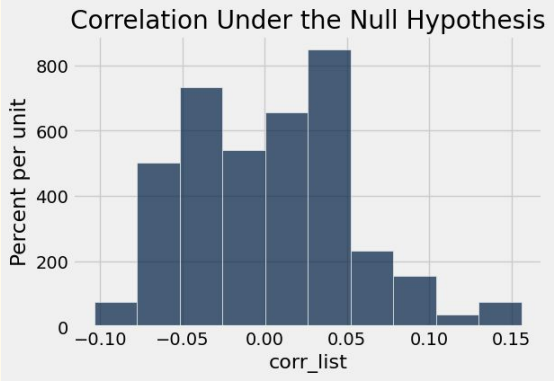
Conclusion:

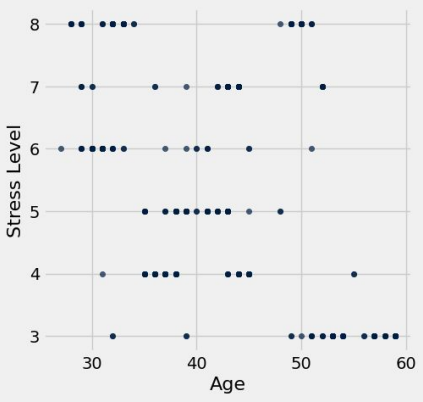
- **Layman's version:** there is strong evidence supporting the claim that higher sleep quality leads to lower stress levels.
- **Scientific version:** assuming null hypothesis that there is no relationship between stress level and quality of sleep, the chance of seeing a difference at -0.899 or larger is less than 0.001. We reject the null hypothesis at a significance level of 0.001

Permutation Test: Age vs. Stress Level

Observed correlation: -0.898752031004
p-value<0.001

-0.898752031004





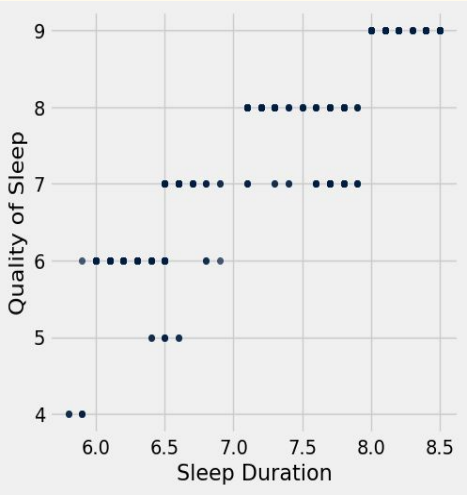
H0: there is no association between Age and Stress Level

H1: Older age is associated with lower stress level and vice versa.

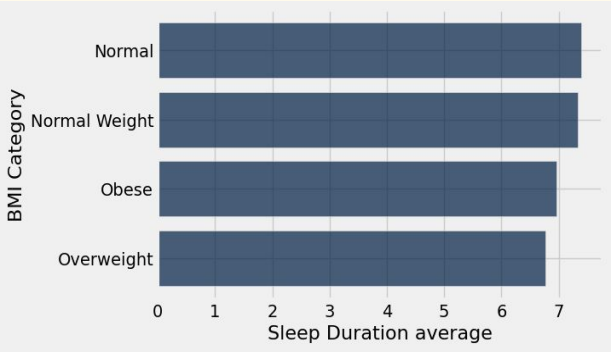
Conclusion:

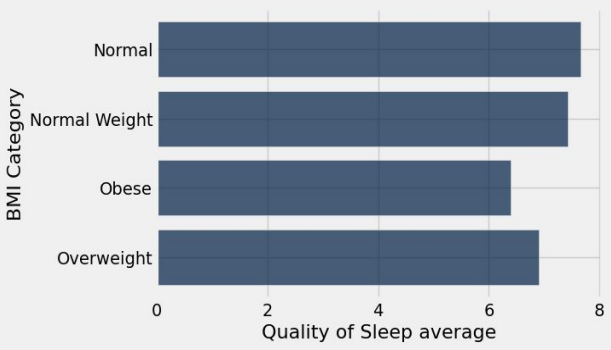
- **Layman's version:** there is strong evidence supporting the claim that older age is associated with lower stress level.
- **Scientific version:** assuming null hypothesis that there is no relationship between age and stress level, the chance of seeing a difference at -0.899 or larger is less than 0.001. We reject the null hypothesis at a significance level of 0.001

Data Insight: Overweight and Obese people sleep less and get poorer quality sleep than people with Normal weight.

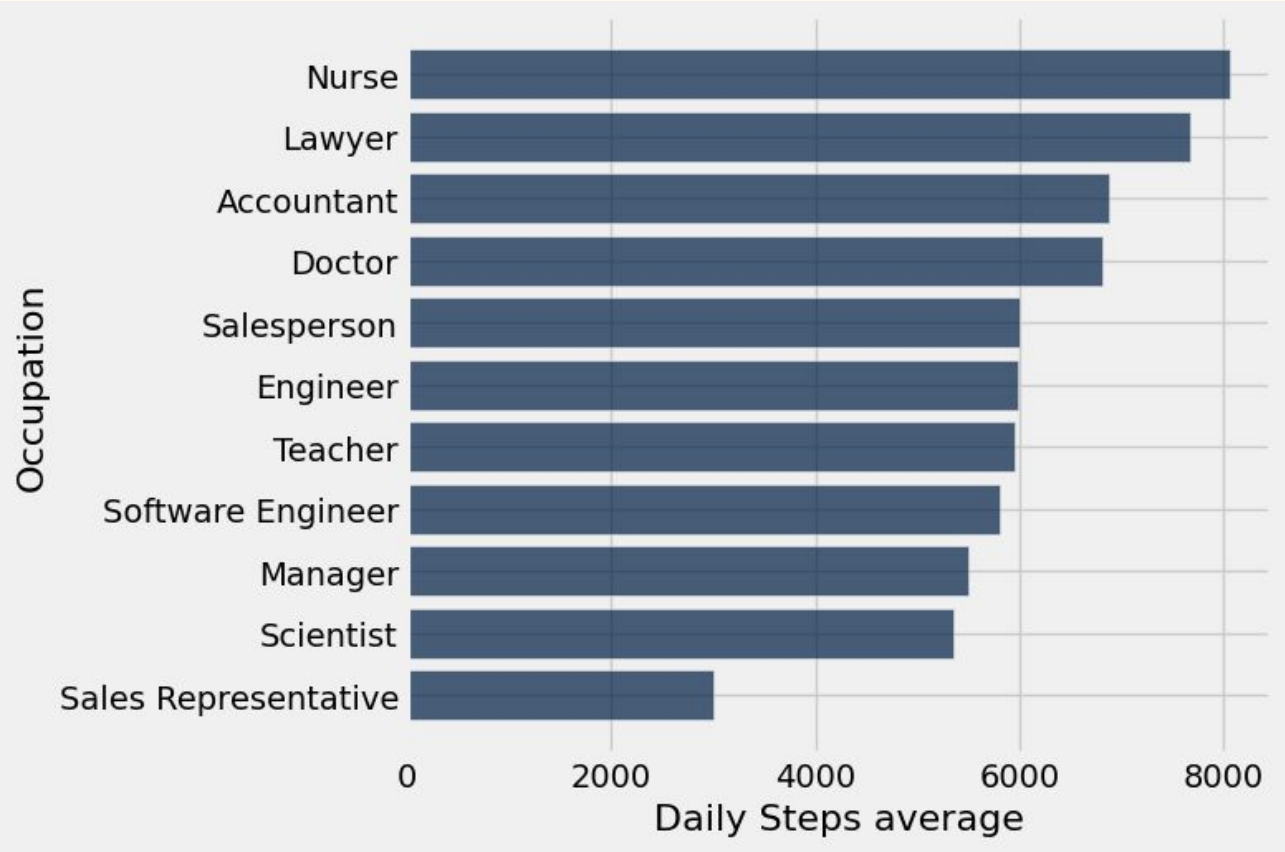


BMI Category	count
Normal	195
Normal Weight	21
Obese	10
Overweight	148



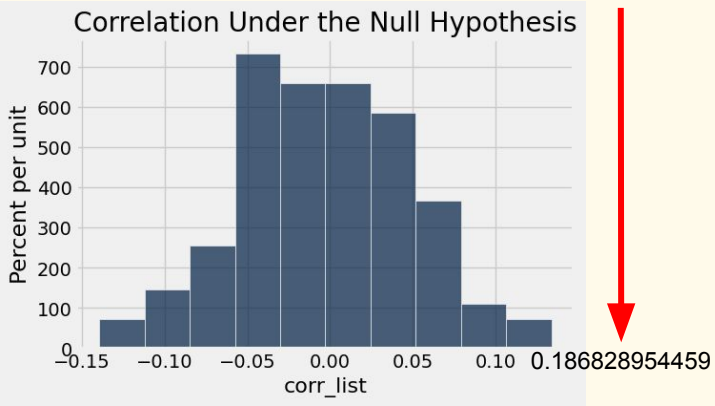


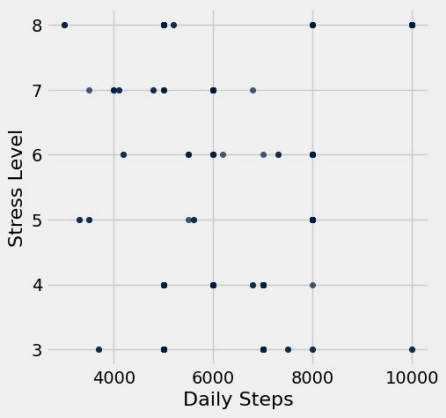
How do Daily Steps correlate with Stress Levels?



Permutation Test: Daily Steps vs. Stress Level

Observed correlation: 0.186828954459
p-value<0.001





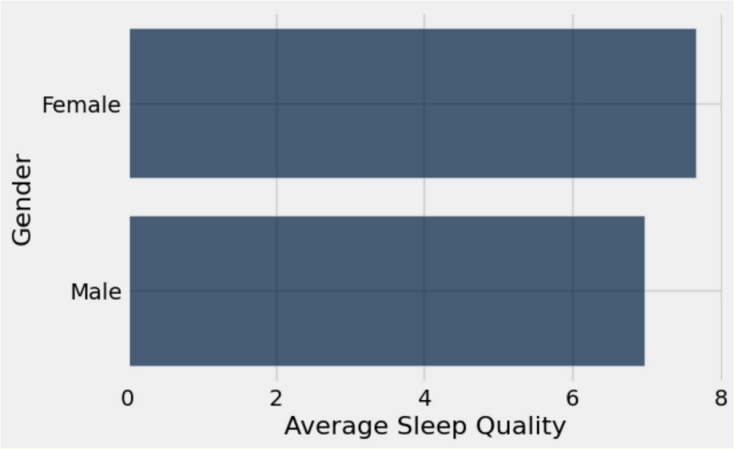
H0: there is no association between Daily Steps and Stress Level

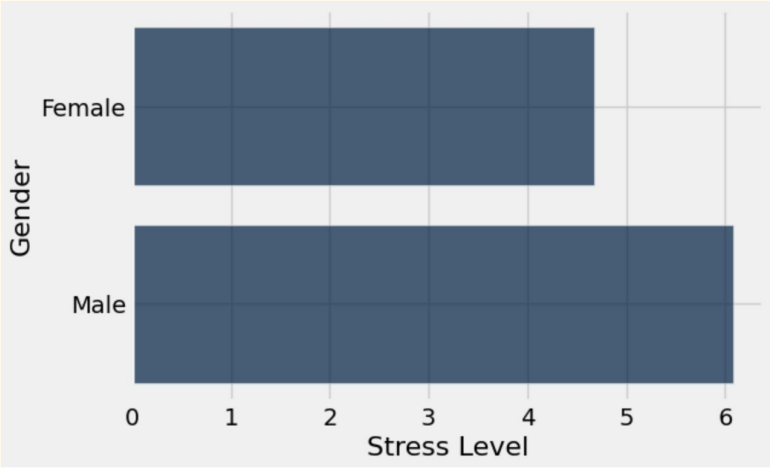
H1: Higher Daily Steps is associated with lower Stress Level and vice versa.

Conclusion:

- **Layman's version:** there is strong evidence supporting the claim that higher daily step count is associated with lower stress level.
- **Scientific version:** assuming null hypothesis that there is no relationship between daily steps and stress level, the chance of seeing a difference at 0.186 or larger is less than 0.001. We reject the null hypothesis at a significance level of 0.001

How Gender Impacts Average Sleep and Stress Levels in ALL Fields





By Brittany Huynh

Average Male Salesperson Data 👨🏻‍💼

Link

35 Years Old

5 out of **10** Sleep Quality Score 💤

7.5 out of **10** Stress Level Score 🧘🏻‍♂️

4500 Daily Steps 🏃🏻‍♂️

37.5 Physical Activity Level

Overweight (BMI 25 to 29.9)

Link to source

Male Salespersons are the most stressed individuals in this dataset. They live relatively unhealthy lifestyles with a low overall sleep quality score, a low-normal level of daily physical activity, and are overweight.

(Based on the data of 32 male salespersons)

By Brittany Huynh

Average Female Engineer Data 🛠️

Link

53 Years Old

9 out of **10** Sleep Quality Score 💤

3 out of **10** Stress Level Score 🧘‍♀️

5000 Daily Steps 🏃‍♀️

30 Physical Activity Level

Normal Weight (BMI 18.5-24.9)

Link to source

Female engineers are the least stressed individuals in this dataset. They also live relatively healthy lifestyles with a high overall sleep quality score, a normal level of daily physical activity, and normal weight BMI category.

(Based on the data of 32 female engineers)
